

ABSTRACT

An improved mouse structure has a cover and a base pivotally connected to the cover. The cover is an elliptically curved shell with two ends, and has a pivoting portion extending downwardly from one of the ends thereof as well as
5 a hook formed on another end thereof. The base comprises a receiving portion formed on an end thereof for receiving the pivoting portion, an engaging seat formed on another end thereof, and an engaging hole formed in the engaging seat for engaging with the hook.
